Postpartum Hemorrhage Hypothetical Case Studies Wisconsin

Late PPH occurs 1 day to 6 weeks after delivery. Risk for bleeding r/t ineffective involution of uterus and hx of postpartum hemorrhage; risk factors: >5 g/p, maternal age >35 yo, pt is not breastfeeding [which aids in uterine contraction], and slight increase in bleeding was seen toward end of shift.

Case Study: Postpartum Hemorrhage by Cheryn Bejar

Postpartum haemorrhage (PPH) and eclampsia, accounting for 34% and 29% respectively, are major causes of these deaths . Global experience also suggests that the most common cause of maternal death is severe bleeding (25%) while another 12% of mothers die of eclampsia . These complications can be managed and treated if timely and appropriate care is sought from facilities with necessary skilled care providers.
